Ebrium Doped Fiber Amplifier

ERBIUM DOPED FIBER AMPLIFIER

Content

Foreword

This manual applies to fiber amplifier. It mainly describes the performance characteristics, technical parameters, installation and debugging, common troubleshooting, and other related content of the product. In order to ensure that the equipment can be successfully installed and safely operated, please read this manual carefully before installing and debugging the equipment. And the installation and debugging should be strictly according to the specified steps on the manual to avoid unnecessary damage to equipment or accident harm to the operator. Any questions, please contact with us in time. Special Tips:

■ Er Yb Codoped Fiber Amplifier is high end professional equipment, and its installation and debugging must be operated by special technician. Read this manual carefully before operating to avoid damage to equipment caused by fault operation or accident harm to the operator.

■ While the fiber amplifier is working, there is an invisible laser beam from the optical output adapter on the front panel. Avoiding permanent harm to the body and eye, the optical output should not aim at the human body and human should not look directly at the optical output with the naked eye!

■ Please make sure that the ground terminal of the case and power outlet has been reliably grounding before turning on the power (Grounding resistance should be ＜4Ω) to prevent the static damage the pump laser device and harm to human because of case charged.

■ To ensure the equipment can work stable over a long time, in voltage unsteady or poor voltage wave region, it´s recommend to the customer that he equips special AC regulated power supply, or even AC uninterrupted power supply (UPS)system for conditional users. In the region with large temperature variation environment (The equipment's ideal work

environment temperature is 25°C) or bad room environment, it´s recommend to the customer that he equips special air-condition system to improve the work environment.
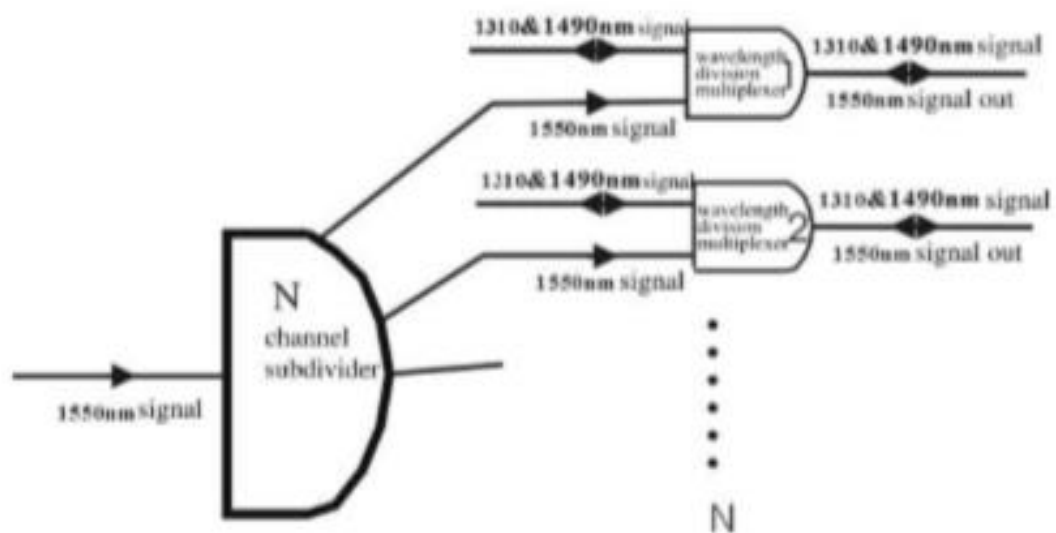

Application

- Single-modefiber1550amplificationnetwork
- FTTH network
- CATV network
- Long distance trunk network. FTTx PON, max working wavelength:1529.16~1563.86nm.
- All kind sof SDH/PDH transmission system.

Performance Characteristics

- Built-in optical fwdm, it can transmit broadband network and CATV together.
- Adopts Er Yb Codoped double-clad fiber technology;
- Catv input ports:1 optional
- Olt input ports: 8-16-32 optional
- Com Output ports:4-32optional;
- Optical output power: total output up to 4mW, 6mW, 14mW, 23mW
- Low noise figure: <6dBwheninputis0dBm
- Perfect network management interface, in line with standard SNMP network management;
- Intelligent temperature control system make the power consumption lower

Technique Parameter

Item		Unit	Technique Parameters	
Operating bandwidth		nm	1545-1565	
Optical input power range		dBm	-3 - +10	
Optical Switching time		ms	≤5	
Maximum optical output power		dBm	41	
Output power stability		dBm	±0.5	
Noise figure		dB	≤6.0	Optical input power 0dBm, λ=1550nm
Return loss	Input	dB	≥45	
	Output	dB	≥45	
Optical Connector Type			CATVIN:SC/APC, PON:SC/PCORLC/PC COM:SC/APCORLC/APC	
PON to COM port insertion loss			≤1.0	dBm
C/N		dB	≥50	Test condition according to GT/T184-2002.
C/CTB		dB	≥63	
C/CSO		dB	≥63	
Power Supply Voltage		V	A:AC100V-260V (50Hz~60Hz) B:DC48V(50Hz~60Hz) C:DC12V(50Hz~60Hz)	

Power Consumption	W	-8port * 19 dbm with wdm: 30 w -16port * 19 dbm with wdm: 40 w -16port * 23 dbm with wdm double IN: 50 w -32port * 19 dbm with wdm: 50w -32port * 23dbm with wdm double IN: 70 w	
Operating temperature range	°C	-10 - +42	
Maximum operating relative humidity	%	Max 95% no condensation	
Maximum storage relative humidity	%	Max 95% no condensation	
Dimension	Mm	483(L)×440(W)×88(H)	

External Function Description
Front Panel Description

Schematic diagram of the front panel

1) Power indicator: One switching power supply is working – yellow; two switching power supplies are working–green.

2) Optical input power indicator This light turns on when the optical input power is>-10dBm.

3) Pump working status indicator: Red light means the pump is not working, but the machine parameters are normal; flashing red light means the machine has broken down, related fault reason see the alarm menu of the display menu; green light means the pump is working normal.

4) Optical output power indicator: This light turns on when the optical output power is>+10dBm.

5) 160×32 dot-matrix LCD screen: used to display all the parameters of the machine.

6) Display the exit or cancel key of the setup menu.

7) Display the up or increase key of the setup menu.

8) Display the down or decrease key of the setup menu.

9) Display the enter key of the setup menu.

10) Optical signal output: This interface is the optical signal output port of the device. The default connector type is SC/APC; the port number is 4-32 optional. Other specification requirement are specified by the customer. Warning: There is an invisible laser beam from this port while working normal. So the port should not be aligned to the human body or the naked eye to avoid accidental injury.

11) Optical signal input: The default connector type is SC/APC. Other specification requirements are specified by the customer.

12) Pump lasers witching key: used to control the working status of pump laser. "ON" means the pump laser is open and "OFF" means the pump laser is closed. Ensure the key is on "OFF" position before power on. After passing self-test, rotate the key to "ON" position according to the displayed message.

Rear Panel Description

1) Fan out et.

2) RS232 interface: Used for configuring the network management parameters.

3) LAN interface: correspondtoIEEE802.310Base-T, used for network management.

4) The AC220V input port of power supply.

5) The fuse of power supply

6) The switch of power supply

7) The AC220V input port of power supply

8) The fuse of power supply

9) The switch of power supply.

10)Ground stud of the chassis: used for the connection of device and ground wire.

DC Power Module Introduction

Installation debugging

Unpack and Check

1. In sure the package is not defaced. If it has any damage or water mark, please contact local agency or carrier.

2. After unpacking, check equipment's and accessories according to package list. Any question, please contact local agency or our company.

3. If you think the equipment has been damaged, please don't electrify to avoid worse damage. Please contact local agency or our company in time.

Instruments and tools

1. An optical power meter;

2. A digital multimeter;

3. A standard optical fiber test jumper (SC/APC);

4. Some absolute alcohol and medical cotton wool;

Installation steps

1. Before installing the equipment, please read the <User's manual> carefully and install the equipment according to the <User's manual>. Note: For the man-made damage and other all consequence caused by error installation that not according to the <User's manual>, we will not be responsible and will not supply free warranty.

2. Take out the device from the box; fix it to the rack and reliably grounding. (The grounding resistance must be <4Ω).

3. Use the digital multimeter to check the supply voltage, make sure the supply voltage comply with the requirements and the switch key is on the "OFF" position.

Then connect the power supply.

4. Input the optical signal according to the display message. Turn the switch key to the "ON" position and observe the front panel LED status. After the pump working status indicator turn into green, the device is working normal. Then press the menu button on the front panel to check the working parameters.

5. Connect the optical power meter to the optical signal output end by the standard optical fiber test jumper, then measure the optical output power. Affirm the measured optical output power

and the displayed power are the same and have reached the nominal value. (Affirm the optical power meter is on 1550nm wavelength test position; the optical fiber test jumper is the matched one and on the connector surface has no pollution.) Remove the standard optical fiber test jumper and optical power meter; connect the device to the network. So far, the device has been completely installed and debugged.

Clean and maintenance method of the optical fiber active connector

In many times, we consider the decline of the optical power as the equipment faults, but it may be caused by that the optical fiber connector was polluted by dust or dirt. Inspect the fiber connector, component, or bulkhead with a fiberscope. If the connector is dirty, clean it with a cleaning technique following these steps:

1. Turnoff the device power supply and carefully pull off the optical fiber connector from the adapter.

2. Wash carefully with good quality lens wiping paper and medical absorbent alcohol cotton. If use the medical absorbent alcohol cotton, still need to wait 1~2 minutes after wash, let the connector surface dry in the air.

3. Cleaned optical connector should be connected to optical power meter to measure optical output power to affirm whether rith as been cleaned up. 4. When connect the cleaned optical connector back to adapter, should notice to make for ceap propriate to avoid china tube in the adapter crack.

5. If the optical output power is not normal after cleaning, should pull off the adapter and clean the other connector. If the optical power still low after cleaning, the adapter may be polluted, clean it.

(Note: Be carefully when pull off the adapter to avoid hurting inside fiber.)

6. Use compressed air or degrease alcohol cotton to wash the adapter carefully. When use compressed air, the muzzle aims at china tube of the adapter, clean the china tube with compressed air. When use degrease alcohol cotton, insert directions need be consistent, otherwise can't reach a good clean effect.

Special notice: a. In the process of clean the active optical fiber connector, you should avoid direct shining at eye, which will cause permanence burn!!!! b. Use proper energy to install the active optical connector, or the ceramic tape in the adaptor will lead to break. Once the ceramic tape is broken, the optical output power will decrease rapidly. And turn the active optical fiber connector slightly, the optical output power changes obviously.

c. Please operate the optical fiber under the condition of shut off the pump laser. Or the high output power will lead to burn the joint of the optical output fiber, which will cause the output power decrease.
